

Herschel Data Analysis Guerilla Style: Keeping flexibility in a system with long development cycles

Bernhard Schulz

NASA Herschel Science Center

- The Herschel Common Science System (HCSS) software accompanied the development of the Herschel mission through all phases of development.
- Large multinational development effort in Java with >5*10⁵ lines of code and >200 contributors
- Functions:
 - scientific proposal submission
 - observation scheduling,
 - spacecraft and instrument commanding
 - data downlink
 - data processing
 - instrument calibration
 - data archival

Data Processing

- Jython is used as script language to invoke Java modules
- Many libraries:
 - Numerics Package with up to 5 dim arrays, fitting etc.
 - Plotting Package
 - Object Oriented Database Access Late
 - Toolboxes: Mapping, Spectroscopy, FITS IO, etc...
 - Flight dynamics library (coordinates etc.)
- Other cool features
 - Task Framework
 - Data Products have FITS file equivale
 - Calibration Source Database
 - Debugger
- HIPE: Interactive programming environment similar to Eclipse

System Development

- The Herschel Science Centre (ESA), the Instrument Control Centres (HIFI, PACS and SPIRE) and the NHSC jointly manage and contribute to the Herschel Data Processing System
- All releases can be downloaded via
 - http://herschel.esac.esa.int/ HIPE_download.shtml
- Latest HIPE developer releases are available via
 - <u>http://herschel.esac.esa.int/</u> <u>CIB_disclaimer.html</u>
- Many intermediate developer builds on a daily basis
- Major new version so far every 3 months
- Now changing to 6 months cycle

Early Issues

- In the beginning the learning curve was really steep
- Hard to keep track of changes
- Highly nested data structures produced very complex Jython expressions to access data in memory print obs.refs["level1"].product.refs[2].product["signal"]["PSWE8"].data[0]
- Object oriented database system relatively complex
- Need for instrument builders to use a system that is in the process of development
- No time to make things "user friendly"

page (#)

The three data analysis choices

- Pipeline processing
 - Easy and straight forward
 - No flexibility
- Editing and running a script
 - Sophisticated and long learning curve
 - Full flexibility
- Interactive analysis with GUIs
 - Relatively easy to learn
 - Limited flexibility
- Straight pipeline results may be good enough for science analysis at a future date, but not yet.
- For astronomers with limited resources to learn the system, the GUI IA seems to be the optimal choice

The Dilemma

- Need for rapid results during instrument
 performance verification and calibration
- Pipelines only available as Jython scripts
- Need to simplify the system for "normal" astronomers
- Need to reduce potential for human error during data processing
- Turnaround cycles slow and decision making slow with many contributing parties
- Ideological divide between "Command line fundamentalists" and "GUI Geeks"

page <#>

Guerilla Tactics

- If you are impatient: Do it yourself!
- At some point one realizes:
 - All the building blocks are there!!
- Take a weekend or two and have fun!provided you have such to spare...
- Result: SPIA (SPIRE Photometer Interactive Analysis)

Tasks in SPIA

Task Name	Category	Description
spiaCalCopyHsa	SPIRE	Loads specified calibration context from HSA into session and saves it to local store as default calibration context.
spiaLoadCal	SPIRE	Loads calibration context into session. Option to get newest calibration from own local store or potentially older calibration that came originally with the data.
spiaLoadUrn	SPIRE	Loads observation context from local store identified by URN.
spiaLoadObs	SPIRE	Loads SPIRE observation context from local store identified by obsid. Optional path to different local store directory can be given (somewhat outdated, use product browser instead).
spiaCopyHsa	SPIRE	Copy observation from HSA to local store.
spiaLevel0_5	SPIRE	Reduce SPIRE photometer scan map data from Level 0 to Level 0.5 and run jump detectors and deglitchers without the "repair" option. Most parameters are GUI accessible. The masks can be inspected and corrected afterwards using the spireMaskEditorTool.
spiaLevel1Repair	SPIRE	Reduce SPIRE photometer data from Level 0.5 to Level 1, assuming that spiaLevel0_5 was used before to mask glitches and jumps in the Level 0.5 data. This module only "repairs" previously flagged glitches and completes processing to Level 1.
spiaLevel1	SPIRE	Reduce SPIRE photometer scan map data from Level 0 to Level 1. Many parameters especially of the deglitchers are GUI accessible. This reflects the standard pipeline processing if parameters are kept at their default settings. This module detects and repairs glitches in one go on Level 1 but doesn't set the masks at Level 0.5 nor allows for intermediate inspection at Level 0.5. To inspect and potentially correct glitch and jump detections you can run the tasks spiaLevel0_5 and spia_Level1Repair instead.
spiaLevel2	SPIRE	Reduce SPIRE photometer scan map data from Level 1 to Level 2 maps. Most parameters are GUI accessible. Allows combination of up to 5 Level1 contexts into one map and does allow for different baseline removal algorithms.
spiaSaveObs	SPIRE	Save observation to pool. Options for different path to local store directory and saving of Level 1 or Level 2 only stores.
spiaSaveMaps2Fits	SPIRE	Save Level 2 maps to FITS files.
spiaConcatL1	SPIRE	Concatenate selectable Level1 signal timelines from all building blocks into one table dataset that can be easily inspected with TableOverPlotter.
spiaPlotPosition	SPIRE	Plots the Level 1 track of a detector over one of the Level 2 maps of an observation context. The context must contain both Level 1 and Level2 products.

Task Framework

- Clear structure requiring definition of input and output parameters with type, default values, tooltips, help
- Integrated into HIPE (registering)
- Common look default GUI
- Records history
- Tasks can be executed as subroutines in other tasks or scripts for batch processing
- Disadvantage: static GUI that can not change based on user input

Import task framework classes. from herschel.ia.task.all import * # Import data structures from java classes needed from herschel.ia.dataset.all import * from herschel.ia.numeric.all import * # Import our algorithm from average import average

class Average(JTask):

The input parameter 'table' is passed as the argument of the function self.result = average(self.table)

- https://nhscsci.ipac.caltech.edu/sc/index.php/Spire/SPIA

Conclusive Remarks

- HCSS has become a system with huge potential
- Parallel development of software system and hardware is a successful concept
- Needs of three communities must be balanced
 - Developers, Instrument scientists, Astronomers
- You can not start early enough in a mission with planning for the software environment.
- Flexibility in a system is very useful
 - Helps to make up for omissions in the plan
 - Better: if a clear vision for limits of scope and need dates of functionalities are established early.
- A user friendly environment that hides most complexities must be part of the plan
